

Pallet changer with stacking function PARATUS® Change +STACK

The PARATUS® Change +STACK is a particularly compact system that combines pallet changing and stacking. As a pallet changer with a stacking function, it completes two steps in one pass without requiring extra effort.

First, the pallet change takes place as usual. The loaded start pallet is placed in the device and the target pallet is picked up with an industrial truck. The target pallet is then used to push the start pallet out the back. In less than 30 seconds, the goods are safely on the target pallet.

The emptied start pallets, however, are not returned; they are automatically stacked directly above the push-out area. This creates an especially space-efficient solution, which is ideal for storage areas where every square meter counts.

Further details:

- multiple-reinforced construction
- premium quality: made in Germany
- powder coating
- smooth, shiny surface
- anthracite grey RAL 7016
- special colour possible
- stainless steel possible
- size depending on pallet
